

Operating mode: The operating mode is set by parameter C00.

C00=0 slave-direct operation. This operating mode is not available in model FCM00NTC00. In slave-direct operation, the 0÷10V output of the control is directly proportional to the value of probe 1. The minimum value of the probe (0V or 0mA or 4mA) corresponds to the min. value of the output (param. C04); the maximum value of the probe (10V or 20mA) corresponds to the max. value of the output (param. C05). The AUX LED indicates the operating status of the digital output relay (according to parameter C31).

C00=1 slave-reverse operation. This operating mode is not available in model FCM00NTC00. In slave-direct operation, the 0÷10V output of the control is inversely proportional to the value of probe 1. The minimum value of the probe (0V or 0mA or 4mA) corresponds to the maximum value of the output (param. C05); the maximum value of the probe (10V or 20mA) corresponds to the minimum value of the output (param. C04). The AUX LED indicates the operating status of the digital output relay (according to parameter C31).

C00=2 direct operation. In direct operation, the control's 0÷10V output increases as the values measured by the probes increase, as a function of the set-point (param. St1) and the other control parameters. The AUX LED indicates the operating status of the digital output (relay).

C00=3 reverse operation. In reverse operation, the control's 0÷10V output decreases as the values measured by the probes increase, as a function of the set-point (param. St1) and the other control parameters. The AUX LED indicates the operating status of the digital output (relay).

C00=4 direct(set1)/reverse (set1) operation switched by the digital input. The operating mode depends on the status of the digital input, ID1: ID1 not active (open): direct operation (param. St1 and P01); ID1 active (closed): reverse operation. The AUX LED indicates the status of the digital input.

C00=5 direct(set1) /direct(set2) operation switched by the digital input. The operating mode depends on the status of the digital input, ID1:ID1 not active (open): direct operation with main set-point and differential (param. St1 and P01); ID1 active (closed): direct operation with secondary set-point and differential (param. St2 and P02). The AUX LED indicates the status of the digital input.

C00=6 reverse(set1)/reverse(set2) operation switched by the digital input. The operating mode depends on the status of the digital input, ID1: ID1 not active (open): reverse operation with main set-point and differential (param. St1 and P01); ID1 active (closed): reverse operation with secondary set-point and differential (param. St2 and P02). The AUX LED indicates the status of the digital input.

C00=7 direct(set1) /reverse(set2) operation switched by the digital input (summer/winter operation). The operating mode depends on the status of the digital input, ID1: ID1 not active (open): direct operation with main set-point and differential (param. St1 and P01); ID1 active (closed): reverse operation with secondary set-point and differential (param. St2 and P02). The AUX LED indicates the status of the digital input.

C00=8 direct(set1) /reverse(set2) operation + Defrost switched by the digital input (cooling/heating operation with Defrost). The operating mode depends on the status of the digital input, ID1: ID1 not active (open): direct operation with main set-point and differential (param. St1 and P01); ID1 active (closed): reverse operation with secondary set-point and differential (param. St2 and P02) and Defrost cycle management (param. P40, P41, P42, P43, P44 and P45). The AUX LED indicates the status of the digital input and the enabling of the defrost command (flashing).

Multifunction digital inputs. The terminal block can accept two digital inputs which can be associated to two commands, chosen from those available, by setting parameters C29 and C30. In the case where an operating mode is set which requires terminal block command, the ID1 input is automatically associated to the command itself. Where both digital inputs are available, if the two inputs are assigned the same function (alarm or enabling), the ID1 input has priority. **C29/C30=0: not used**

C29/C30=1: alarm with automatic reset. When the alarm is active (open contact), the analog output is instantly forced to 0V, and the relative alarm is generated. The alarm condition is maintained until the contact is closed again.

C29/C30=2: alarm with manual reset. When the alarm is active (open contact), the analog output is instantly forced to 0V, and the relative alarm is generated. The alarm condition must be cancelled manually from the keypad, after the contact has been closed again.

C29/C30=3: alarm delay with manual reset. As above, with the exception that the alarm is activated only after a set time (parameter P28) has elapsed.

C29/C30=4: enabling/inhibition. In the case of inhibition (open contact), the analog output is instantly forced to 0V.

C29/C30=5: 0÷10V output at 100%. When the contact is closed, the analog output is forced to 10V.

Multifunction digital output (relay). The terminal block is fitted with a digital relay output, to which one of the following functions is associated, with the possibility to choose between normally energised relay or normally de-energised relay (parameter C31). When the Heating/Cooling operating mode with Defrost is selected (parameter C00=8), the relay is used to control the Defrost function, irrespective of the programming.

C31=0: output not used (relay not energised)

C31=1/2: generic alarm signal. Relay de-energised/energised in the case of an alarm.

C31=3/4: 0÷10V output signal active. Relay de-energised/energised when the voltage of the 0÷10V output is not 0V.

C31=5/6: Maximum output signal. Relay de-energised/energised when the voltage of the 0÷10V output is at the maximum set value, with 0.5V hysteresis. (Not affected by the speed-up function). **C31=7/8: Regulation ON/OFF.** Relay de-energised/energised when the voltage of the 0÷10V output is at the maximum set value, and energised/de-energised when the voltage of the 0÷10V output is at the minimum set value. (Not affected by the speed-up function).

Operation and alarm signals

- OUT LED OFF indicates that the 0÷10V output is inhibited (0V), ON indicates that the output is regulating, flashing indicates that the output is at the maximum programmed value.
- AUX LED depends on the operating mode selected (see "Operating mode" description). In the case of digital input command inhibition (C29/30 = 4), the signal "—" is displayed, alternating with the display of the value. In case of an alarm, the buzzer sounds and the alarm code is displayed – cyclically – together with any other alarms and the normally-displayed value. The value is displayed only if the relative probe is connected (disconnection recognition is possible only with NTC and 4÷20mA probes).

Alarm type	Effects on regulation	Effects on the digital output (supposing C31=1,2)	Reset
Er0 = Probe 1 disconnected	the 0÷10V output depends on C10 (if Defrost is ON, the action remains on as normal until the max. scheduled time has elapsed)	ON	control is automatically restored on re-connection; manual reset for buzzer and display
Er1 = Probe 2 disconnected (if C19 is different from 0)	the 0÷10V output depends on C10 (if C19=4 and Defrost is OFF, regulation is not affected)		
Er2 = Parameter memory malfunct.	disabled with analog output at 0V	no effect	Reprogramming
Er3 = External alarm (from digital input)	disabled with analog output at 0V and display	ON	manual or autom. program.; manual reset for buzzer
Er4 = High temperature alarm	depending on C10 (no effect or analog output at 100%)	ON	reset is automatic with programm. differential (manual reset if differential is very high)
Er5 = Low temperature alarm			differential (manual reset if differential is very high)
EdF = Defrost end with maximum time	no effect on control	no effect (not available)	reset is automatic in the next correct cycle

Technical specifications

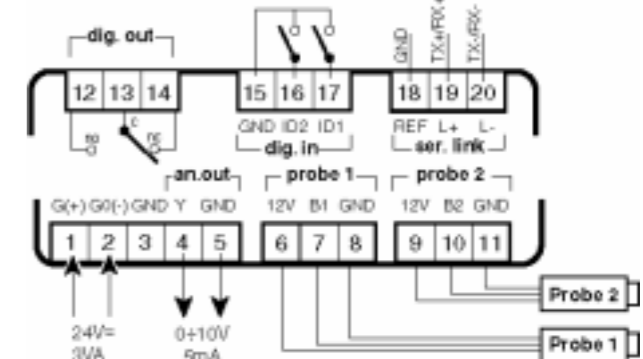

Power Supply	24Vac/dc, -20%, +10%, 50/60Hz
Power consumption	3VA (External fuse 315mA T)
Operating range	Temperature: -40T100 (-40÷100°C; -40÷212°F); pressure: 0.0÷100 bar; humidity: 0.0÷100 % r.H. -10T70 (-10÷70°C, 23.8÷158°F); humidity below 90%r.H. non-condensing
Storage conditions	OT50 (0÷50°C, 32÷122°F); humidity below 90%r.H. non-condensing
Operating conditions	OT50 (0÷50°C, 32÷122°F); humidity below 90%r.H. non-condensing
Case	Plastic; dimensions: 72x88x64mm
Index of protection	IP20 (IP40 with panel mounting)
Mounting	DIN rail
Connections	Screw terminals for wires with max 1.5mm ² and min 0.5mm ² cross-section
Classification according to protection against shock	Class II
Number of automatic cycles for each automatic action (e.g.: relay)	100.000
Type of action-microswitching	1C
PTI of materials used for insulation	250V
Environmental pollution	Normal
Heat and fire resistance category	Category D (self-extinguishing complying with UL94-V0)
Category (surge immunity)	Category II
Software class and structure	Class A
Analog inputs	FCM00NTC00: 2 x NTC CAREL 10kΩ at 25°C probes FCM0001000: 2 x 0÷10V voltage inputs FCM0002000: 2 x 0÷20mA or 4÷20mA current inputs
Digital inputs	2 free contact-type with user-programmable function (max contact resistance 50Ω) 12Vdc, +10%, I _{max} =50mA total
Aux. power output	1 x 0÷10V, I _{max} =5mA, minimum load 2kΩ
Analog output	1 SPDT relay with user-programmable function, I _{max} =8A res. (2A), Vac _{max} =250V
Digital output	1 SPDT relay with user-programmable function, I _{max} =8A res. (2A), Vac _{max} =250V
Serial line (optional)	2-lead RS-485
Display	3 digit with 7-segment LEDs; 2 LEDs for active analog output and special functions
Device cleaning	when cleaning do not use ethylic alcohol, hydrocarbons (petroleum), ammonia and its derivatives. Only use neutral detergents and water.
Disposal of the product	please, avoid disposing the device in domestic rubbish. To dispose the device refer to the environmental protection laws in force in your Country.
Safety standards	To guarantee correct installation complying with the relative safety standards (EN 60730-1) the following indications should be respected: <ul style="list-style-type: none">• the contact connecting cables must ensure insulation up to 90°C;• power the device at 24V using safety transformers.

Table of parameters

Parameter	Type	Min	Max	U. M.	Def.
PASSWORD				-	77
SET-POINT parameters					
St1* Set-point 1 (main)	St	-40	100	°C/rH/bar	0.0
St2* Set-point 2 (secondary) - parameter accessible only if C00=5,6,7,8	St	-40	100	°C/rH/bar	0.0
C00 Operating mode	C	0	8	-	2
P01* St1 differential	P	0.0	100	-	2.0
Analog output management parameters					
P02* St2 differential - parameter accessible only if C00=5,6,7,8	P	0.0	100		2.0
C03* Type of set-point	C	0	2	-	0
Analog management parameters					
C04 Minimum output value	C	0	C05	%	0
C05 Maximum output value	C	C04	100	%	100
C06 Sofstart min. time to move from 0% to 100%	C	0	120	s	2
C07* Cut-off (disabling differential)	C	0.0	100	-	0.0
C08* Speed-up	C	0	120	s	0
C09* Integrative action	C	0	999	s	0
C10 Output value when: probes disconnected or high temp. alarm (Low in reverse)	C	0	5	-	0
Input management parameters					
C13 Type of probes (according to model)	C	0, 1, 3	0, 2, 7	-	0, 1, 6
C14* Type of refrigerant - parameter accessible only if C13=2,4,6.	C	0	7	-	0
C15* Minimum value for current or voltage inputs (parameters not accessible if C13=0)	C	-40	C16	°C/rH/bar	0.0
C16* Maximum value for current or voltage inputs (parameters not accessible if C13=0)	C	C15	100	°C/rH/bar	100/30.0
C17 Probe input filter (time constant)	C	0.0	10.0	s	1.0
Alarm management parameters					
P25* Low alarm threshold	P	-40	P26	°C/rH/bar	-40
P26* High alarm threshold	P	P25	100	°C/rH/bar	100
P27* Low and High alarm differential	P	0.0	100	°C/rH/bar	2.0
P28 Alarm enabling delay	P	0	999	s	1
Digital I/O management parameters					
C29 ID1 multifunction digital input management Param. accessible only if C00=0, 1, 2, 3	C	0	5	-	0
C30 ID2 multifunction digital input management.	C	0	5	-	0
C31 Multif. digital output (relay) management - parameter not accessible in Defrost mode (C00=8)	C	0	8	-	0
Measurement management parameters					
C32 Display unit of measure displayed in bar	C	0	2 or 3	-	2
C33 Normally displayed value	C	0	5	-	-
P34 Probe measur. as indicated by par. C19	P	-	-	-	-
P35 Probe1 measurement (main)	P	-	-	-	-
P36 Probe2 measurement (secondary)	P	-	-	-	-
P37 Output value (%)	P	-	-	-	-
P38 Probe 1 input value (%)	P	-	-	-	-
P39 Digital input and output status	P	00.0	11.1	-	-
Defrost management parameters (DEFROST: parameters accessible only if C00=8)					
P40* Defrost activation threshold	P	-40	P41	°C/rH/bar	0
P41* Defrost disactivation threshold	P	P40	100	°C/rH/bar	100
P42* Defrost activation delay	P	0	240	s	5
P43* Maximum Defrost duration	P	1	60	minute	1
P44* Minimum interval between defrost starts	P	1	240	minute	1
P45* Output value during Defrost	P	0	100	%	0
KEYPAD/REMOTE control parameters					
C50 Keypad and remote-control enabling	C	0	4	-	4
C51 Remote-control enabling code	C	0	99	-	0
Serial connection management parameters					
C52 Type of serial connection	C	0	2	-	1
C53 Serial address	C	0	255	-	0
C54 Baud-rate/data destination address	C	0	3 if C52=1 32 if C52=2	-	0
C55 Frame/page	C	0	11 if C52=1 255 if C52=2	-	0
C56 Send reply delay with supervisor	C	0	255	ms	50
C57 Hardware board enabling; do not modify	C	0	255	%	255

U. M.= unit of measure; Def.= default value. (*) parameters not accessible in slave mode. **Note:** if you wish to display the temperature in °F rather than °C, the conversion is performed automatically.

Schemi elettrici / Electrical diagrams

Collegamento delle sonde / Probe connection

Sonde NTC / NTC probes

Sonde 0÷10 V generatore
Generator 0÷10V probes

Sonde 0÷10 V potenziometro
Potentiometer 0÷10V probes

(*) Si consiglia di connettere una resistenza da 820Ω in serie
(* It is recommended to connect an 820Ω resistor in series)

Sonde 0÷20 mA o 4÷20 mA generatore
Generator 0÷20mA or 4÷20mA probes

Sonde 0÷20 mA o 4÷20 mA tipo SPK
SPK-type 0÷20mA or 4÷20mA probes

Sonde 0÷20 mA o 4÷20 mA tipo CAREL / 0÷20mA or 4÷20mA CAREL-type probes

Nota: con una sonda si può omettere il collegamento della resistenza R200Ω previo ponticello tra i morsetti 7-B1 e 10-B2.
Note: using a probe, it is possible to inhibit the R200Ω resistance connection, if the 7-B1 and 10-B2 terminals are bridged.
